OLUSANYA TIMOTHY

Software Engineer — AI Red Team & Evaluation

Lagos, Nigeria | olusanyatimothy54@gmail.com | +234 812 786 8211 | olusanyatimothy.dev
github.com/Teamthy | linkedin.com/in/olusanya-timothy

Software engineer working across two sides of the same problem: production platforms in Go and TypeScript, and the evaluation infrastructure that decides whether an AI system actually held. I build the unglamorous layer — contracts checked in CI, double-entry ledgers in integer kobo, row-level security, dead-letter queues — and open-source harnesses that emit evidence rather than reports.

CORE COMPETENCIES

Languages: Go, TypeScript, Python, SQL, Bash

Backend: chi, Express 5, Next.js route handlers, Prisma, Drizzle, PostgreSQL (RLS), Redis, SQLite, REST / OpenAPI

Frontend: Next.js 15, React 19, Tailwind CSS, TanStack Query, Expo / React Native

AI & security: Agent red teaming, prompt injection, LLM-judge auditing, evidence bundles, crash consistency, ONNX Runtime, OWASP Agentic Top 10, MITRE ATLAS, NIST AI RMF

Practices: API contracts enforced in CI, double-entry ledgers, RBAC and tenant isolation, OpenTelemetry / Prometheus, GitHub Actions, Docker, technical writing

AI RED TEAM & EVALUATION — OPEN SOURCE

Independent research practice

2026 – Present | github.com/Teamthy

- tieout — evidence-grade agent evaluation harness. Every verdict is a bound, chained, re-derivable event; `tieout verify` re-derives 14/14 verdicts from stored raw output with no model, no key and no network. Ships negative controls (0 FP / 0 FN), judge-audit metrics and exact Clopper-Pearson intervals.
- gatecheck — CI security gate for agents that blocks a pull request only when the agent gets easier to break. Fingerprinted findings diffed against a committed baseline; 7 findings from 11 attacks in under a second, including multi-turn escalation; SARIF and PR comments.
- host-failure-benchmark — standard-library benchmark for crash consistency in agent audit trails. Four failure rows, 13 persistence checks, 3 verification checks, and a mutation suite (10 damage modes plus regression cases per audited finding).
- ai-redteam-five-tests — runnable harness for five recurring AI failures (prompt injection, poisoned retrieval, unread tool descriptions, monolingual refusals, unmeasured rates) against any OpenAI-compatible endpoint, including mixed Pidgin/Yoruba refusals.

PLATFORM ENGINEERING

Product delivery — Go and TypeScript

2026

- EduMart OS — exam-preparation platform for Nigerian learners: Go API serving a Next.js web app, PWA and Expo app. 48 documented routes checked against the router in both directions on every CI run; server owns session state, deadlines, scoring and authorisation.
- Famex OS — single-school operating system: 140+ API routes, 70 models, a double-entry ledger in signed kobo with an unbalanced-journal constraint, PostgreSQL row-level security with a CI coverage guard, and a test suite of roughly 900 tests.
- YK Virtual — curriculum-governed tutoring marketplace and virtual school: Go modular monolith with escrow, booking-scoped messaging, staged vetting and an OpenAPI contract as the source of truth; OpenTelemetry and Prometheus from day one.
- I CONFESS — daily confession and audio platform: Go API with a Next.js web app and Flutter client, delivered across eight audited phases with CI/CD workflows.
- VisionForge — computer-vision inference platform: Go API, Python ONNX service, Redis workers with visibility timeouts and a dead-letter queue, presigned S3/MinIO uploads and full Prometheus/Grafana instrumentation.

CLIENT BACKENDS

- AssetFlow — Express 5 + Drizzle multi-tenant fixed-asset API: permission-based RBAC across seven roles, branch-scoped queries enforced at the data layer, JWT access and refresh tokens, Swagger contract at /api/docs.

- Olasco Autos — request-led vehicle platform for Lagos and Abuja: Zod-validated intake persisted with Prisma/PostgreSQL, one WhatsApp handoff, and documentation that states plainly what the platform does not promise.
- CDRL — pnpm monorepo for the Centre for Digital Risk & Leadership: Next.js site plus Express/ Prisma API, CI running typecheck, zero-warning lint, Vitest, production builds, dependency audit and gitleaks.

OPEN SOURCE, WRITING & LINKS

- Public repositories and case studies: github.com/Teamthy (115 repositories, Go / TypeScript / Python).
- Long-form notes on evaluation evidence, red-team gates in CI, crash consistency and financial data modelling.
